The Proofs

Integro-Differential
Equation
Diffusion type
representation,
Equivalence of
measures

Concluding
Remarks

Challenge

To present a new approach to analysis of mixed Gaussian processes based on the linear filtering theory.

Motivation

To construct the likelihood type estimates for mixed Gaussian noises systems:

$$Y_t = \int_0^t f(\theta, s) ds + X_t, 0 \leq t \leq T,$$

Object of studies

Mixed
Gaussian
processes

Cai,

measures

Concluding
Remarks

I. Gohberg and M. Krein

- Factorization theory of Fredholm operators in Hilbert spaces:

$$(Id + K)^{-1} = (Id + L_+)(Id + L_-)$$

with right and left Volterra kernels L .

- Resolvent identity for a continuous kernel K

$$L(s, t) + \int_0^t L(r, t)K(r, s)dr = -K(s, t), \quad 0 \leq s \leq t \leq T.$$

- The crucial role of the equation

$$g(s, t) \int_0^t g(r, t)K(r, s)dr = 1, \quad g(s, s) \neq 0.$$

50 years ago; independently; at the same time

T.Kailath

- the relevance of I. Gohberg and M. Krein theory:
- Shepp's density formula is rewritten in the form

$$\frac{d\mu^X}{d\mu^B}(X) = \exp\left(-\int_0^T \varphi_t(X) dX_t - \frac{1}{2} \int_0^T \varphi_t^2(X) dt\right),$$

where

- $\varphi_t(X) = \int_0^t L(s, t) dX_s$ with $L \in L^2([0, T]^2)$ being the unique solution of the Wiener-Hopf integral equation

-

$$L(s, t) + \int_0^t L(r, t) K(r, s) dr = -K(s, t), \quad 0 \leq s \leq t \leq T.$$

Concluding
Remarks

M.Hitsuda

- $\mu^X \sim \mu^B$ if and only if X can be represented as

$$X_t = \bar{B}_t - \int_0^t \int_0^s \ell(r, s) d\bar{B}_r ds,$$

with *some* Brownian motion \bar{B} and *some* Volterra kernel $\ell \in L^2([0, T]^2)$.

- Actually the kernel ℓ solves the Riccati-Volterra equation:

$$\ell(s, t) = K(s, t) - \int_0^{t \wedge s} \ell(s, r) \ell(t, r) dr.$$

Example

Multiplicity Greater than One

$$X_t = B_t + \xi \int_0^t \frac{1}{\sqrt{|1-s|}} ds,$$

where $\xi \sim N(0, 1)$ is independent of B .

- ξ can be recovered precisely from \mathbb{F}_t^X for all $t \geq 1$.
- \mathbb{F}_t^X is discontinuous at $t = 1$,
- with $\mathbb{F}_{t-}^X \subsetneq \mathbb{F}_t^X = \mathbb{F}_t^B \vee \sigma\{\xi\}$ for all $t \geq 1$.

$$\text{with } \phi_s = 1 - \int_0^s L(r, s)dr.$$

Canonical Representations

Theorem

The process

$$\bar{B}_t = \mathbb{E} \left(\int_0^t \phi_s dB_s \middle| \mathbb{F}_t^X \right)$$

is a Brownian motion, satisfying

$$\bar{B}_t = \int_0^t q(s, t) dX_s,$$

The representation

$$X_t = \int_0^t \hat{q}(s, t) d\bar{B}_s$$

with $\hat{q}(s, t) = -\frac{\partial}{\partial s} \int_s^t q(r, s) dr$, is canonical, i.e. $\mathbb{F}_t^X = \mathbb{F}_t^{\bar{B}}$.

Fundamental Martingale Representation

$$M_t = \int_0^t g(s, t) dX_s, \quad \langle M \rangle_t = \int_0^t g(s, t) ds, \quad t \geq 0.$$

The kernel $g(s, t)$ solves integro-differential equation:

Equation for the Kernel

$$g(s, t) + H \frac{d}{ds} \int_0^t g(r, t) |s-r|^{2H-1} \text{sign}(s-r) dr = 1, \quad 0 < s < t \leq T$$

The family of functions $\{g(s, t), 0 \leq s \leq t \leq T\}$ plays the key role in our approach to analysis of the mixed fBm.

Fundamental Martingale Representation via X

Fundamental Martingale Representation

Concluding
Remarks

Let $Y = (Y_t)$ defined by

$$Y_t = \int_0^t f(s) ds + X_t, \quad t \in [0, T],$$

Then Y admits the representation

$$Y_t = \int_0^t G(s, t) dZ_s$$

The fundamental semimartingale $Z = (Z_t)$

$$Z_t = \int_0^t g(s, t) dY_s = M_t + \int_0^t \Phi(s) d\langle M \rangle_s,$$

and

$$\Phi(t) = \frac{d}{d\langle M \rangle_t} \int_0^t g(s, t) f(s) ds.$$

The measures μ^X and μ^Y

In particular, $\mathbb{F}_t^Y = \mathbb{F}_t^Z$, P -a.s. for all $t \in [0, T]$ and, if

$$E \exp \left\{ - \int_0^T \Phi(t) dM_t - \frac{1}{2} \int_0^T \Phi^2(t) d\langle M \rangle_t \right\} = 1,$$

then the measures μ^X and μ^Y are equivalent and the corresponding Radon-Nikodym density is given by

$$\frac{d\mu^Y}{d\mu^X}(Y) = \exp \left\{ \int_0^T \hat{\Phi}(t) dZ_t - \frac{1}{2} \int_0^T \hat{\Phi}^2(t) d\langle M \rangle_t \right\},$$

where $\hat{\Phi}(t) = E(\Phi(t) | \mathbb{F}_t^Y)$.

Properties of $g(s, t)$ on the diagonal

The function $g(t, t)$, $t \in [0, T]$ satisfies the properties:

- $g(t, t)$ is continuous on $[0, T]$ with
 $g(0, 0) := \lim_{t \rightarrow 0} g(t, t) = 1$
- $g(t, t) > 0$ for all $t \in [0, T]$
-

$$\int_0^t g(s, t) ds = \int_0^t g^2(s, s) ds.$$

Integral Equation with $H > 1/2$, II

Properties of $\dot{g}(s, t) = \frac{\partial}{\partial t}g(s, t)$

The kernel $g(s, t)$ satisfies the following properties

- $g(s, t)$ is continuously differentiable at $t \in (0, T]$ for any $s > 0, s \neq t$;

- the derivative $\dot{g}(s, t) := \frac{\partial}{\partial t}g(s, t)$ satisfies the equation

$$\dot{g}(s, t) + H(2H - 1) \int_0^t \dot{g}(r, t) |r - s|^{2H-2} dr =$$

$$-H(2H - 1)g(t, t) |r - s|^{2H-2}, \quad s \in (0, t).$$
