fractional Brownian motion

B_t^H is a fractional Brownian motion with Hurst parameter $H \in (0, 1)$, i.e. zero mean Gaussian process with the correlation function

$$K(s, t) = \mathbb{E}B^H(t)B^H(s) = \frac{1}{2} \left(|t|^{2H} + |s|^{2H} - |t - s|^{2H} \right),$$
$$s, t \in [0, T].$$

B^H is not a semimartingale on its own filtration, unless $H = \frac{1}{2}$ or $H = 1$.

Fundamental Martingale Representation via X

Fundamental Martingale Representation

$$M_t = \int_0^t g(s, t) dX_s, \quad \langle M \rangle_t = \int_0^t g(s, t) ds, \quad t \geq 0.$$

The kernel $g(s, t)$ solves integro-differential equation:

Equation for the Kernel

$$g(s, t) + H \frac{d}{ds} \int_0^t g(r, t) |s-r|^{2H-1} \text{sign}(s-r) dr = 1, \quad 0 < s < t \leq T$$

The family of functions $\{g(s, t), 0 \leq s \leq t \leq T\}$ plays the key role in our approach to analysis of the mixed fBm.

Representation of X via M

The following representation holds:

$$X_t = \int_0^t G(s, t) dM_s, \quad t \in [0, T],$$

where

$$G(s, t) := 1 - \frac{d}{d\langle M \rangle_s} \int_0^t g(\tau, s) d\tau, \quad 0 \leq s \leq t \leq T.$$

and, in particular, $\mathbb{F}_t^X = \mathbb{F}_t^M$, P -a.s. for all $t \in [0, T]$.

The fundamental Semimartingale

Let $Y = (Y_t)$ defined by

$$Y_t = \int_0^t f(s) ds + X_t, \quad t \in [0, T],$$

Then Y admits the representation

$$Y_t = \int_0^t G(s, t) dZ_s$$

The fundamental semimartingale $Z = (Z_t)$

$$Z_t = \int_0^t g(s, t) dY_s = M_t + \int_0^t \Phi(s) d\langle M \rangle_s,$$

and

$$\Phi(t) = \frac{d}{d\langle M \rangle_t} \int_0^t g(s, t) f(s) ds.$$

7 Concluding Remarks

Drift estimation in mixed fractional noise

Let

$$Y_t = \theta t + B_t + B_t^H, \quad t \in [0, T]$$

MLE of θ

The MLE of θ is given by

$$\hat{\theta}_T(Y) = \frac{\int_0^T g(s, T) dY_s}{\int_0^T g(s, T) ds},$$

For $H \in (0, 1)$ this estimator is strongly consistent and the corresponding estimation error is normal

$$\hat{\theta}_T - \theta \sim N\left(0, \frac{1}{\int_0^T g(s, T) ds}\right),$$

Mixed fBm for
 $H < 1/2$
Integro-Differential
Equation

Reduction to the case $H > 1/2$

Then the Gaussian process

$$\tilde{U}_t = \int_0^t \tilde{\rho}(s, t) dB_s$$

has covariance function with integrable partial derivative

$$\tilde{\kappa}(\mathbf{s}, t) := \frac{\partial^2}{\partial \mathbf{s} \partial t} \mathbb{E} \tilde{U}_s \tilde{U}_t = |t - \mathbf{s}|^{-2H} \chi \left(\frac{\mathbf{s} \wedge t}{\mathbf{s} \vee t} \right), \quad \mathbf{s} \neq t,$$

where $\chi(\cdot)$ is a continuous function, and the process $\tilde{X} = \tilde{B} + \tilde{U}$ with $H < \frac{1}{2}$ has the structure, similar to the original process X with $H > \frac{1}{2}$.

Equation

Alternative Forms, I

The kernel $g(s, t)$ is the unique continuous solution of the following equations:

- for $H \in (0, 1]$, the integro-differential equation:

$$g(s, t) + H \frac{d}{ds} \int_0^t g(r, t) |s - r|^{2H-1} \text{sign}(s - r) dr = 1.$$

- for $H \in (\frac{1}{2}, 1]$, the **weakly singular integral** equation:

$$g(s, t) + H(2H - 1) \int_0^t g(r, t) |s - r|^{2H-2} dr = 1.$$

Integro-Differential
Equation

Properties of $g(s, t)$ on the diagonal

The function $g(t, t)$, $t \in [0, T]$ satisfies the properties:

- $g(t, t)$ is continuous on $[0, T]$ with
 $g(0, 0) := \lim_{t \rightarrow 0} g(t, t) = 1$
- $g(t, t) > 0$ for all $t \in [0, T]$

■

$$\int_0^t g(s, t) ds = \int_0^t g^2(s, s) ds.$$

Integral Equation with $H > 1/2$, II

$$\text{Properties of } \dot{g}(s, t) = \frac{\partial}{\partial t}g(s, t)$$

The kernel $g(s, t)$ satisfies the following properties

- $g(s, t)$ is continuously differentiable at $t \in (0, T]$ for any $s > 0, s \neq t$;

- the derivative $\dot{g}(s, t) := \frac{\partial}{\partial t}g(s, t)$ satisfies the equation

$$\begin{aligned} \dot{g}(s, t) + H(2H - 1) \int_0^t \dot{g}(r, t) |r - s|^{2H-2} dr = \\ -H(2H - 1)g(t, t) |r - s|^{2H-2}, \quad s \in (0, t). \end{aligned}$$

- $\dot{g}(\cdot, t) \in L^2([0, t])$ for $H > 3/4$

Integro-Differential
Equation

Singularity of Measures

$$L_t := \int_0^t g(s, t) dW_s,$$

must be a semimartingale under P . Define

$$\psi(s, t) = - \int_s^t g(r, r) \sum_{m=1}^{n_0-1} (-1)^m \kappa^{(m)}(r, s) dr, \quad 0 < s < t \leq T,$$

where n_0 is the least integer greater than $\frac{1}{4H-2}$. Then
 $\psi(\cdot, t) \in L^2([0, t])$.

$$H \leq 3/4, II$$

Singularity of Measures, II

Define

$$U_t := \int_0^t \psi(s, t) dW_s$$

$$V_t := \int_0^t (g(s, t) - g(s, s) + \psi(s, t)) dW_s.$$

Then

$$\int_0^t g(s, t) dW_s = V_t + \int_0^t g(s, s) dW_s - U_t.$$

- U has zero quadratic variation, but unbounded first variation
- V has bounded first variation.
